# WEATHER SYNOPSIS BY REGION

## **NORTHERN CALIFORNIA**

\*\*\* High Risk NE CA and Far Eastside this afternoon through Saturday evening due to gusty and shifting wind and low humidity\*\*\*

\*\*\* High Risk Sacramento Valley-Foothills, Mid Coast-Mendocino and Northern Sierra this afternoon and evening due to gusty and shifting wind and low humidity\*\*\*

Projected wind speeds have come down a bit for the upcoming fire weather event but they will still be gusty and sometimes erratic. The strong offshore low will provide a partial break down of the ridge/high, currently centered over NV, during the next 48 hours. Wind speeds will increase with gusts between 20-30 mph across a broad area during the next two afternoons to early evening's. Gusts up to 35 mph will be possible along the western edge of the Sacramento Valley including the Delta region during the next two to three evenings. A moist onshore flow will be pronounced along the coast during the next couple of days. Still expecting a dry cold frontal passage late this afternoon and evening. A pronounced wind shift will affect western portions of the Sacramento Valley as well as portions of Siskiyou and Modoc counties as a result. Humidity values will generally rise slightly but remain low during the day periods with some single digits and teens expected in the gustier wind areas. Smoke concentrations overall near the surface should also thin some during the next two afternoon's due to increased transport wind flow. Adding up all of the ingredients, a High Risk has been issued for portions of the region through Saturday.

Sunday appears to be a transition day although some gustier breezes will remain across the area. Gusts between 20-30 mph should impact the region for a few hours and be accompanied with a few teen humidity readings. A drier NE wind should also affect the North Coast. Isolated thunderstorms should also approach the Tahoe Basin from the south late Sunday.

Weather models continue to converge on bringing tropical moisture associated with John and Monsoon Moisture, currently located, over southern CA northward next week. Still too early to determine impact locations but chances of thunderstorms are on the rise next week.

## **SOUTHERN CALIFORNIA**

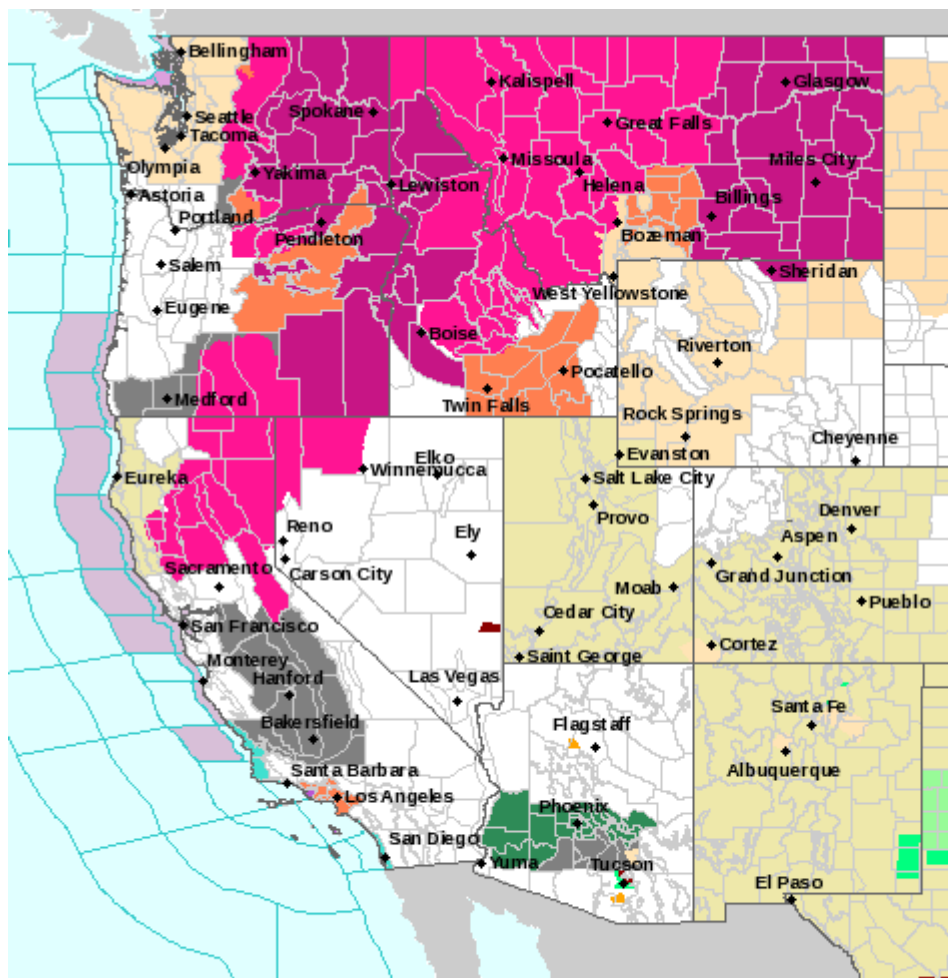

\*\*\*Isolated wet thunderstorms over portions of Southern California\*\*\*

\*\*\*Gusty winds possible from Inyo and Tuolumne Counties this afternoon into Saturday\*\*\*

Outflow from thunderstorms originating over Nevada and Arizona has kept the airmass very warm and humid overnight over Southern California. Therefore, temperatures will be off to a running start, resulting in well above normal readings despite a return of onshore flow. Expect highs to reach the 100 degree mark in many of the valleys and foothills with afternoon temperatures well into the 80s in the mountains. Isolated wet thunderstorms will be possible in the Sierras south of Fresno County, the deserts south of I-15 and in the local mountains from northern Ventura County southward toward San Diego County. Elsewhere, onshore flow will bring some northwest winds of 10-20 mph along the central coast and Kern County Mountains the next two days. A front moving into the Pacific Northwest will result in widespread gusty winds north of the district, but some infrequent gusts to 30 mph will be possible in the high Sierra from Yosemite National Park northward late this afternoon into Saturday. Cooler weather is expected over the weekend into the first part of next week as high pressure drifts a little further east of the area. Highs will be back in the 90s in the valleys with breezy conditions returning a few desert interface areas during the afternoon hours. A handful of storms will be possible on the desert sides of the San Bernardino and Cleveland National Forest each afternoon through Monday. Warmer weather with a better chance of thunderstorms will likely return for the second half of next week.
